<u>**Requirements Document**</u>

Project Name: DineAlert
Requirements and Specification Document
07/07/2021, version <u>1</u>

<u>Project Abstract</u>

Our DineAlert web application will provide customers and restaurant owners with two buttons, where they choose either option i.e if they're dining or operating a restaurant. Both customers and restaurant owners will **login** with their username and password. When registering their restaurants, owners will enter the **restaurant name, a unique username and password.** The credentials can be chosen by each restaurant owner. Once logged in, restaurant owners have a list of customers with their contact information, including whether they're positive for COVID-19. If any client is positive, the restaurant will email all the clients (including positive patients), asking them to isolate and get themselves tested for COVID-19.

Customers will enter their **username, name**, **their email address** and **password** into a form and will be redirected to a thank you page confirming their submission.

<u>Customer</u>

Our web application involves two main customers, who will often use our application:
1. Restaurant Owners
2. Diners at the restaurant

<u>Competitive Analysis</u>

The COVID-19 pandemic has digitized the sign-up process for several restaurants, requiring customers to declare their COVID-19 test results before dining in. Therefore, we believe that our main competitors involve restaurant owners, who have created digitally sign-up forms at their physical locations, which allows customers to report their test results. Our project, which is a web application, allows users to report their test results without having to visit the restaurant personally. Compared to our competitors, who require customers to visit a restaurant to sign up, this would save time for customers as well as restaurant owners and reduce the contacts with potential COVID-19 carriers. Furthermore, restaurant owners can easily contact clients directly (using the client information stored in the database) and quickly, sending a mass email rather than individually contacting each customer.

User Stories

Our web application involves the following two <u>actors:</u>
➔ Customers
➔ Restaurant owners, who are provided admin permissions to view customer information and send each customer email.

Story 1: Warning clients of potential COVID-19 breakout (Iteration 1)

The customer will be able to declare if he is positive for COVID-19 (by clicking on a checkbox) and mention the specific restaurant he or she visited, including the hour they visited the restaurant. Based on the specific restaurant chosen from the list, that restaurant will email all the other customers (including the positive patient as well), instructing them to get tested and self-isolate for a stipulated time.

Story 2: Restaurants owner can create an Admin Account (Iteration 1)

The restaurant owner will be able to create an account in order to log in to the DineAlert app. If the restaurant owner uses the DineAlert for the first time, they first click on the "Create account" button, enter the name of the restaurant, username, password and then click on the "Create account" button again to create an account. However, if the username is already taken, they will be prompted to enter a different username. If an account is successfully created, the user information will be submitted to the DineAlert, with a success page confirming the creation of the account.

Acceptance test:

Once account information is submitted, a new row will be created on the Restaurant table, which contains the restaurant owner's restaurant name, username and password.

Story 3: Admin Login (Iteration 1)

The restaurant owner will be able to login into the system, and view a list of customers, who are positive. This is not accessible to other customers, who visited the restaurant.

If the restaurant owner has an account for the DineAlert, they will be able to log in from the login page. On the login page for the restaurant owner, they enter

Markus Robinson 301358252
Zhiran (Andy) Tong 301390137

username, password and then click on the "Login" button. If the correct information is typed in, the restaurant owner will be taken to the page with the message "Logged in!"

Acceptance test:
Once username and password are typed in, the restaurant owner will be authenticated by searching through the Restaurant table, checking if the provided username exists and if it matches with the provided password. If successfully passed authentication, the page will be redirected to the home.html file.

Story 4: Adding a Dining(Iteration 1)
The customer will be provided with a form to fill out for them to receive COVID-19 alert notification in the future.

Once they click the "I am dining" button on the home page, they will be taken to the page that contains fields to fill out. On this page, the customer will enter their name, name of the restaurant, email address and then click on the "Submit" button to submit the information they provided. If all required fields are filled, provided information will be submitted to the DineAlert.

Acceptance test:
Once account information is submitted, a new row will be created on the Dining table, which contains the customer's name, name of the restaurant and email address.

Story 5: Admin Logout(Iteration 1)
The restaurant owner will be able to successfully logout from their DineAlert account.

Acceptance test:
As the owner may be logged in, upon clicking the "Log Out " button, the user will be redirected back to the home page.

Story 6: Return to Home Page(Iteration 1)
The restaurant owner and customer will be able to return to the home page whenever they want.

Color code for each iteration
- **Iteration 1: Black**
- **Iteration 2: Blue**
- **Iteration 3: Purple**

Gaelan O'Shea-McKay 301267831
Markus Robinson 301358252
Zhiran (Andy) Tong 301390137

Whether they are on the login, logged in, or create an account page, they can simply click on the "Return to home" button to go back to the home page. Once the button is clicked, they will be taken to the home page where they choose if they are dining or running a restaurant.

Acceptance test:
Once the restaurant owner or a customer clicks the "Return to home" button, the page will be redirected to the index.html file, which is the homepage.

Story 7: Return to Admin Login Page(Iteration 1)
The restaurant owner will be able to return to the admin login page from creating an account page.

When the restaurant owner is on the creating an account page, they can simply click on the "Back to Admin Login" button to go back to the admin login page. Once this button is clicked, they will be taken to the admin login page where they enter login details.

Acceptance test:
Once the restaurant owner clicks the "Back to Admin Login " button, the page will be redirected to the adminlogin.html file.

User Interface Requirements
Initially, the user (customer/restaurant owner) will be provided with two buttons, depending if they're dining or running a restaurant. Restaurant owners will be directed to a login page, with a registering account button ('Create account').

LOGGED IN:
Once the diner logs in, he or she enters their name, restaurant's name and their email address in a form.

SUBMITTED:
Once the client submits the information, a thank you message is displayed.

Errors possible when registering a client account:
1. Duplicate username - Need to have a unique username
2. Duplicate email address - Unique email as well
